We are proud to build the first new school in the St. Clair-Superior neighborhood in over 100 years!

The new Saint Martin de Porres High School is a 21st century state-of-the-art facility dedicated to our vision of a collaborative, project-based, interdisciplinary learning environment. Phase 1, completed in Spring 2018, represents $21M of this $30M investment in the St. Clair-Superior neighborhood, and is the first new school built in this area in over a century.

The design moves away from the traditional model of single purpose spaces and provides a variety of areas that will directly support the project-based instruction model utilized at the school. Each floor of Phase 1 features five classrooms surrounding a Learning Commons. This arrangement provides the flexibility for each floor to be organized into individual classrooms, a few large group project spaces, or completely opened into one large area that accommodates an entire grade level. Additionally, each floor features a Da Vinci Studio, which provides a Makerspace and allows for hands-on learning; and a conference room for small group learning and one-on-one tutoring. All learning spaces are equipped with interactive whiteboards and touchscreen technology. This shared learning environment promotes peer-to-peer learning which is critical to the development of well-rounded citizens, and the development of “soft skills” required for success in any profession.

Saint Martin believes strongly in the St. Clair-Superior neighborhood, and this investment in our community signals our continued commitment and desire for community-wide improvements.
Students will be able to observe the effects of oxidation on copper from the chemistry lab.

Monumental staircase connects the learning communities.

The third floor offers views of downtown Cleveland and Lake Erie.

THANK YOU TO OUR PARTNERS

Built incorporating the historic Kausek Brothers building with iconic copper domes

3 story, 44,000 square-foot facility

1,971 cubic yards of concrete

278 tons of steel

38,829 bricks

12 exposed structural steel cross based frames

320 people working on the construction site

323 panes of glass
